PROFILE

An analytical and versatile Computer Science student specializing in Full-Stack software engineering, Applied AI systems, and cross-platform architecture. HackerRank Certified Software Engineer Intern with a robust track record of developing multi-user mobile applications, building automated backend logic, and integrating real-time IoT hardware telemetry. Highly adaptive in Agile team environments with strong expertise in optimizing client-side performance, data pipelines, and cost-efficient storage logic.

EDUCATION

President University

Bachelor of Computer Science

September 2024 – Present

GPA: 3.85/4.00

Relevant Coursework: Internet of Things (IoT), Software Engineering, Database Systems, Data Structures & Algorithms, Machine Learning, Computer Vision, Web Development.

PROJECTS

Full-Stack & XR Developer – VR Smart City Infrastructure (Digital Twin Ecosystem)

2026

- Built a real-time Digital Twin ecosystem connecting a VR virtual environment (Unity) with physical IoT hardware (ESP32) via the MQTTX communication protocol.
- Engineered reactive hardware-software feedback loops using ultrasonic sensors and microcontrollers to trigger simultaneous digital and physical asset events.
- Implemented automated dimming logic and touchless mechanics upon proximity detection to optimize system energy efficiency.

Full-Stack & Project Manager – OxyWatch (Wearable IoT Telehealth App)

2026 (Ongoing)

- Co-developed an event-driven telehealth ecosystem utilizing Flutter to parse high-frequency smartwatch biometric data streams (SpO2/Heart Rate).
- Integrated Firebase Firestore as the cloud database core to manage multi-user synchronization and handle real-time patient biometric logging.
- Spearheaded an intelligent rule-based AI Agent module to automatically parse biometric criteria into low-latency clinical anomaly alerts.

Lead AI & Mobile Developer – MERCI (AI Skincare E-Commerce Platform)

2025 – 2026

- Deployed a responsive cross-platform retail app in Flutter integrated with a conversational AI agent for ingredient analysis.
- Formulated strict prompt engineering constraints and structured outputs to mitigate system hallucinations during multi-turn queries.
- Programmed rule-based application logic to evaluate, screen, and flag chemically incompatible cosmetic product pairings.

Lead Backend Developer – Nara Calendar (Contextual AI Planner)

2025 – 2026

- Built a high-performance Flask API and relational database layers (MySQL/SQLite) to securely process user schedules and behavior records.
- Integrated Computer Vision facial recognition to log emotional telemetry data during authentication and text/voice ingestion pipelines.
- Authored backend decision logic to analyze calendar density maps, triggering automated proactive wellness notifications.

Lead Computer Vision Engineer – B-Tect (AI Medical Imaging Platform)

2025

- Created a Python platform utilizing computer vision frameworks to identify root causes of structural anomalies on digital X-rays.
- Architected dynamic object detection pipelines with bounding boxes to locate and tier physical injury pixels across 4 distinct clinical levels.

TECHNICAL SKILLS

Programming & Core Logic: Python, Dart, JavaScript, TypeScript, C/C++, HTML/CSS, Structured Programming Logic.

Frameworks & Web Environments: Flutter, Flask/FastAPI, Node.js, Express, React.js, Next.js, Unity (C#).

AI & Data Engineering: Prompt Engineering, RAG Concepts, Object Detection, Computer Vision, Telemetry Streaming.

Databases & Protocols: MySQL, SQLite, PostgreSQL, MongoDB, MQTTX, HTTP/REST, Firebase (Firestore).

Tools & Systems: Git Version Control, Github, Linux Environment, Docker, Software Automation Testing.

CERTIFICATIONS & TRAINING

Software Engineer Intern Role | Problem Solving (Intermediate) | Python (Basic) – HackerRank (2026)
